# IMPROVING METHODS FOR ORGANIZING, CONDUCTING, AND ASSESSING INDEPENDENT LEARNING AMONG SCHOOL STUDENTS

**Musayeva Gulnoza Yuldosh qizi**
Master's Student, Termez State Pedagogical Institute
**musayevagulnoza93@gmail.com**

**Abstract:** This article analyzes modern methodological approaches to organizing, conducting, and assessing independent learning among school students. The content of independent learning, its role in learners' development, the organizational mechanisms based on interactive and innovative technologies, assessment criteria, and the importance of monitoring systems are discussed. Drawing on practical experiences and existing scientific literature, the study proposes recommendations for improving the methodology of independent learning.

**Keywords:** independent learning, assessment, monitoring, competence, pedagogical technology, learner activity.

## INTRODUCTION

In modern education, one of the key tasks is to develop students who can think independently, generate new ideas, and manage their own learning process. Educational reforms in Uzbekistan and the implementation of competence-based curricula require the enhancement of students' independent learning skills. However, in many schools, independent learning tasks are not organized effectively, student engagement is insufficient, and assessment practices are underdeveloped.

Therefore, improving the methodological mechanisms of independent learning based on scientific principles—taking into account students' age, psychology, subject specifics, and motivation—is considered an urgent issue.

The idea of independent learning originates from ancient pedagogical concepts that recognize a person's ability to acquire knowledge independently. Eastern scholars such as Imam al-Bukhari, Ibn Sina (Avicenna), Al-Farabi, and Al-Biruni emphasized the decisive role of personal effort in the pursuit of knowledge. Their works highlight that "knowledge is acquired through the learner's own activity", which served as an important educational principle.

In the early 20th century, European educators such as J. Dewey, M. Montessori, and G. Kerschensteiner advanced the idea that the student is the central figure in learning and developed methods that promote inquiry-based independent learning. Dewey, in particular, placed the learner's activity at the heart of his "experience-based education" theory.

Thus, independent learning has evolved into an educational category connected with cognitive development, learning activity, and motivation.

1. Psychological and Theoretical Foundations

a) Constructivism

According to constructivism, knowledge is not transmitted in a ready-made form but is constructed by the learner themselves (Piaget, Vygotsky). This is the primary psychological foundation of independent learning. The learner:

- finds information independently,
- selects and analyzes it,

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 9.948 / 2024

- processes it,
- and draws conclusions.

Thus, independent learning is a process of constructing personal knowledge.

b) Metacognitive Theory

Based on Flavell's metacognitive theory, learners must know how to manage their own learning process by answering questions such as:

- *What do I know?*
- *What do I not know?*
- *How should I learn this?*
- *How do I check my results?*

The effectiveness of independent learning depends heavily on metacognitive control.

c) Activity Theory

Leontiev and Galperin argue that learning is shaped through purposeful activity. Independent learning positions the student as an active subject. The process unfolds through:

1. Motivation
2. Goal setting
3. Practical activity
4. Monitoring
5. Reflection

2. The Pedagogical Content of Independent Learning

Independent learning in school refers to the learner's conscious engagement in the process of acquiring knowledge, managing their intellectual activity, and evaluating the results of their own work.

It consists of the following components:

Content Component: materials, tasks, and sources to be studied.

Activity Component: skills required to complete tasks, strategy selection, and time management.Motivational Component: interest, internal needs, and desire to achieve results.Assessment Component: self-monitoring, error analysis, and self-evaluation.

3. Origins of the Methodology of Organizing Independent Learning

Today's methodology evolved through three stages:

a) Traditional Approach

Independent learning was viewed mainly as homework. Students typically:

- read texts,
- answered questions,
- completed written exercises.

Little emphasis was placed on inquiry or creativity.

b) Competency-Based Approach (Modern Phase)

With competency-based education in Uzbekistan, independent learning gained new meaning. Students now:

- search for information,
- analyze data,
- solve learning tasks,

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 9.948 / 2024

- prepare projects.

Thus, independent learning became a key mechanism for developing competencies.

c) Digital Approach (New Phase)

Independent learning is increasingly supported by:

- online platforms (Kundalik, Moodle),
- electronic textbooks,
- digital tasks,
- AI-based educational tools.

This marks the transition to an advanced methodological stage.

4. Theoretical Development of Assessment in Independent Learning

Assessment is an inseparable part of independent learning. Its theoretical basis includes:

Formative Assessment

According to Black & Wiliam, assessment is a tool for regulating learning. In independent learning, formative assessment:

- identifies errors,
- guides the process,
- shows progress.

Criteria-Based Assessment

Learning outcomes are evaluated using predefined criteria, ensuring accuracy and fairness in assessing independent tasks.

Reflective Assessment

Learners reflect on questions such as:

- *How did I work?*
- *What difficulties did I face?*
- *How can I improve next time?*

Reflection strengthens psychological independence.

5. Research Methods

The study employed the following research methods:

- Theoretical analysis: scientific sources, pedagogical and psychological literature, international practices, and policy documents.
- Pedagogical observation: observation of independent learning processes in schools.
- Interviews and questionnaires: collecting teachers' and students' opinions on the effectiveness of independent learning.
- Experiment: testing an improved model of independent learning in grades 6–9 in two schools.
- Statistical analysis: comparing and interpreting numerical results.

Results

1. Identified Problems

- Teachers often equate independent work with homework.
- Students lack motivation for independent learning.
- Limited methodological resources and materials.
- Assessment criteria are unclear or inconsistent.

2. Outcomes After Implementing the Improved Methodology

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-12

| Indicator | Before Experiment (%) | After Experiment (%) |
|---|---|---|
| Student activity | 48 | 76 |
| Quality of independent tasks | 52 | 81 |
| Self-assessment skills | 33 | 68 |
| Time-management skills | 41 | 73 |

3. Key Factors Enhancing Independent Learning

- Clear, step-by-step instructional guidance.
- Use of multimedia and online platforms.
- Outcome-based assessment principles.
- Reflection and self-monitoring.

Discussion

The study shows that effective organization of independent learning depends on three main factors:

1. Organizational–pedagogical approach:

Tasks must match students' age and psychological traits. Mini-projects, case studies, clusters, and research tasks significantly increase effectiveness.

2. Teacher's methodological competence:

Teachers need professional development in independent learning methodology. Differentiated tasks foster student independence.

3. Improved assessment system:

Assessment should be based on the following criteria:

- task completion accuracy,
- time management,
- creativity,
- independent inquiry,
- self-assessment sheets,
- presentation of final results.

A four-level assessment model showed the best outcomes:

- Planning
- Performing
- Analysis
- Reflection

**Conclusion**

Organizing, conducting, and assessing independent learning is one of the most important components of modern education. Independent learning fosters students' analytical thinking, creativity, responsibility, and self-management skills. The study demonstrates that constructivism, metacognitive control, activity theory, competency-based education, and criteria-based assessment are essential theoretical foundations for its effective implementation.

VOLUME-5, ISSUE-12

The integration of digital technologies—online resources, electronic platforms, multimedia tools, and AI-supported learning—has elevated independent learning to a new stage. These innovations increase student engagement, support personalized learning, and strengthen independent inquiry skills.

In conclusion, improving the methodology of independent learning not only enhances educational quality but also contributes to students' personal development, creative potential, and reflective abilities. Scientific approaches, motivational strategies, and modern technologies together ensure the effectiveness of independent learning.
