DEVELOPING MUSICAL–PRACTICAL COMPETENCIES OF 7TH GRADE STUDENTS AS A PEDAGOGICAL PROBLEM

National pedagogical university of Uzbekistan

Fazliddinxon G‘ulomxonov

PhD Candidate

Abstract: This study investigates the development of musical–practical competencies among seventh-grade students as a key pedagogical challenge in secondary education. Using a mixed-methods research design, the study examined the effects of a competency-based instructional model that emphasized active music-making, creative tasks, collaboration, and reflective practice. Data were collected through performance-based assessments, classroom observations, and student self-reflections. The results indicate significant improvement in students' technical performance, expressive abilities, creative engagement, and learning motivation. The findings suggest that integrating practical and reflective approaches into music instruction enhances both musical outcomes and student engagement.

Keywords: music education, musical–practical competence, competency-based learning, secondary school students, active learning strategies.

INTRODUCTION

In recent decades, educational systems worldwide have undergone a fundamental shift from content-oriented instruction toward competency-based learning frameworks. This transformation emphasizes not only what learners know, but what they are able to do with their knowledge in authentic contexts. Within this paradigm, music education is no longer viewed merely as the transmission of theoretical concepts or historical facts, but as a multidimensional process aimed at developing learners' practical, cognitive, emotional, and creative capacities. As a result, the notion of musical–practical competence has emerged as a central construct in contemporary music pedagogy.

Musical–practical competence can be defined as a learner's ability to actively engage in music through performance, interpretation, creation, and critical reflection. It integrates technical skills (such as rhythmic accuracy, pitch control, and instrumental or vocal technique), cognitive skills (musical analysis and understanding of form and style), and affective components. For students in the seventh grade, the development of these competencies is particularly significant. This stage corresponds with early adolescence, a period characterized by rapid cognitive growth, increasing abstract thinking, heightened emotional awareness, and a stronger need for self-expression and social belonging. Music, as a form of artistic and social communication, has unique potential to support these developmental needs.

METHODOLOGY AND LITERATURE REVIEW

This study adopted a mixed-methods research design in order to obtain a comprehensive understanding of the pedagogical processes involved in developing musical–practical competencies among seventh-grade students. The combination of quantitative and qualitative methods enabled both measurement of learning outcomes and exploration of classroom dynamics, student experiences, and instructional practices. A quasi-experimental pre-test/post-test design was used to evaluate the effectiveness of the proposed instructional model, while qualitative observations and student reflections were employed to interpret how and why changes occurred.

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

The participants consisted of 90 seventh-grade students (aged 12–13) from three public secondary schools and three music teachers with teaching experience ranging from 6 to 18 years. The schools were selected through purposive sampling to represent diverse socio-economic and educational contexts. All participating students were enrolled in compulsory music classes and had no formal professional music training outside school. Parental consent and institutional approval were obtained prior to data collection, and ethical guidelines regarding anonymity and voluntary participation were strictly observed.

Data were collected using three main instruments:

1. **Musical–Practical Competence Assessment Rubric**, developed by the researcher, which evaluated students' performance skills (pitch accuracy, rhythm stability, and technical control), musical expression, and creative engagement on a five-point scale.
2. **Classroom Observation Protocol**, focusing on student participation, teacher strategies, peer interaction, and the nature of musical activities.
3. **Student Self-Reflection Questionnaire**, consisting of open-ended and Likert-scale items designed to capture students' perceptions of their learning, motivation, and confidence in music-making.

The reliability of the assessment rubric was tested through inter-rater agreement among two independent music educators, yielding a Cohen's kappa coefficient of 0.82, indicating strong reliability.

The research was conducted over one academic semester (14 weeks). During the first two weeks, baseline data were collected through pre-testing and initial classroom observations. The experimental instructional model was then implemented for ten weeks. This model emphasized active music-making activities, including group singing, simple instrumental performance, rhythmic exercises, improvisation, and short composition tasks. Peer feedback and guided reflection were integrated into each lesson.

RESULTS AND DISCUSSION

The results of the study are presented in accordance with the research objectives and are structured around quantitative findings from the musical–practical competence assessments and qualitative findings derived from classroom observations and student self-reflections. In addition, the findings are interpreted in relation to trends identified in relevant local pedagogical and music education literature.

The comparative analysis of pre-test and post-test data revealed a statistically significant improvement in the overall level of musical–practical competencies among seventh-grade students who participated in the experimental instructional model. Prior to the intervention, the majority of students demonstrated a low to moderate level of practical competence, particularly in performance accuracy, rhythmic stability, and expressive execution. The mean pre-test score across all competency indicators was 2.6 on a five-point scale, indicating limited practical mastery.

Following the ten-week instructional intervention, the mean post-test score increased to 3.8, reflecting a substantial improvement in students' musical–practical abilities. Paired-sample t-test analysis confirmed that this increase was statistically significant ($p < 0.01$). The largest gains were observed in the domains of creative engagement and expressive performance. Specifically, creative engagement scores increased by 31%, while expressive performance improved by 29%. These results suggest that instructional strategies emphasizing active participation and creative tasks were particularly effective.

VOLUME-5, ISSUE-12

Performance-related skills such as pitch accuracy and rhythmic precision also showed notable improvement. Pitch accuracy scores increased by 24%, while rhythmic stability improved by 22%. Although these gains were slightly lower than those observed in creative domains, they remain pedagogically significant, especially considering that many students had limited prior experience with active music-making. This finding aligns with conclusions drawn in local music pedagogy research, which emphasizes that technical musical skills develop gradually and require sustained, practice-oriented instruction.

Classroom observations provided deeper insight into the learning processes underlying the quantitative improvements. During the initial observation phase, student participation was uneven, with only a small number of learners actively engaging in singing or instrumental tasks. Many students appeared hesitant, demonstrating low confidence and limited willingness to perform individually or in front of peers. This observation is consistent with findings in local studies on music education, which note that students often experience performance anxiety due to insufficient practice-oriented instruction in earlier grades.

As the intervention progressed, a marked shift in classroom dynamics was observed. Students became increasingly willing to participate in group performances, rhythmic exercises, and improvisation tasks. Collaborative music-making activities fostered a supportive learning environment, reducing anxiety and encouraging peer learning. Teachers reported that students who were previously passive began to take initiative, volunteer for performance tasks, and offer constructive feedback to classmates.

The use of reflective discussions at the end of lessons also contributed to deeper engagement. Students were observed articulating their learning experiences, identifying specific skills they had improved, and expressing greater awareness of musical elements such as tempo, dynamics, and form. These observations support the assertion in local pedagogical literature that reflection is a key mechanism for internalizing practical competencies.

Analysis of student self-reflection questionnaires revealed positive changes in learners' attitudes toward music lessons and their self-perceived competencies. Prior to the intervention, many students described music lessons as "theoretical," "repetitive," or "difficult." In contrast, post-intervention reflections frequently included descriptors such as "interesting," "creative," and "enjoyable."

Approximately 78% of students reported increased confidence in their ability to perform music, while 82% indicated that they felt more motivated to participate actively in lessons. Students emphasized that group work, improvisation, and creative assignments helped them understand music more deeply and made learning more meaningful. These findings correspond with conclusions drawn in national educational research, which highlights the motivational impact of learner-centered and activity-based instruction .

The results of this study are largely consistent with findings reported in local academic literature on music pedagogy. Researchers within the national context have repeatedly emphasized the need to move away from purely theoretical music instruction toward practice-oriented and competency-based approaches. The observed improvements in student engagement, performance skills, and creative expression reinforce these arguments with empirical evidence.

However, this study also extends existing literature by providing a structured instructional model and empirical data specific to seventh-grade learners. While previous local studies have often

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

focused on primary education or general pedagogical principles, the present research demonstrates how musical–practical competencies can be systematically developed during early adolescence.

The findings of this study provide empirical support for the effectiveness of a competency-based, practice-oriented approach to music education in developing the musical–practical competencies of seventh-grade students. The significant improvements observed across technical, expressive, and creative domains indicate that active music-making is not merely a supplementary activity but a central pedagogical mechanism through which meaningful musical learning occurs.

One of the most important outcomes of the study is the substantial growth in students' creative engagement and expressive performance. These domains showed the highest rates of improvement, suggesting that learners particularly benefit from instructional strategies that allow autonomy, experimentation, and personal expression. This finding is consistent with constructivist learning theory, which posits that learners construct knowledge most effectively through active involvement and personal meaning-making. In the context of music education, creative tasks such as improvisation and composition provide students with opportunities to internalize musical concepts by using them rather than merely describing them.

The observed improvements in technical skills such as pitch accuracy and rhythmic stability also demonstrate the value of regular, structured performance practice. Although these skills developed more gradually, their consistent improvement over the intervention period confirms that technical competence is best fostered through repeated, contextualized practice embedded in meaningful musical activities. This challenges traditional approaches that isolate technical exercises from expressive or creative contexts and supports integrated pedagogical models that treat technique and expression as interdependent dimensions of musical competence.

Another significant finding concerns changes in students' motivation and self-confidence. The qualitative data revealed that students became more willing to participate, take risks, and perform in front of peers. This shift is pedagogically important because affective factors such as confidence and motivation are closely linked to sustained engagement and long-term learning. The collaborative nature of the instructional model, particularly group performances and peer feedback, appears to have played a crucial role in creating a supportive learning environment that reduced performance anxiety and encouraged experimentation.

The role of reflection also merits attention. Guided reflection enabled students to become more aware of their learning processes and progress, fostering metacognitive skills that are often neglected in arts education. By articulating what they had learned and how they had improved, students developed a more coherent understanding of musical concepts and their own competencies. This aligns with contemporary educational perspectives that emphasize reflection as a core component of competency development.

CONCLUSION

This study set out to examine the development of musical–practical competencies among seventh-grade students as a pedagogical problem and to evaluate the effectiveness of a competency-based, practice-oriented instructional model in addressing this challenge. The findings clearly indicate that systematic integration of active music-making, creative tasks, collaborative learning, and reflective practice leads to meaningful improvements in students' musical performance, expressive abilities, creative engagement, and learning motivation.

The results confirm that musical–practical competence is not a static outcome of knowledge acquisition but a dynamic construct that emerges through sustained engagement in musical activity.

When students are provided with opportunities to sing, play instruments, improvise, compose, and reflect on their learning, they develop a deeper and more functional understanding of music. This approach supports the transition from passive reception of musical information toward active participation in musical culture, which is a central goal of contemporary competency-based education.

In conclusion, developing musical–practical competencies in secondary education is both a pedagogical necessity and an opportunity. When approached through coherent, activity-based, and reflective instructional models, music education can foster not only technical and creative skills but also motivation, confidence, and cultural engagement. Such outcomes reinforce the value of music as an integral component of holistic education and as a powerful medium for personal and social growth.
