Abstract: The article provides a comprehensive theoretical and practical analysis of the necessity and significance of green financing. It presents statistical evidence on the development of the global green bond market as well as the evolution of the green finance system in Uzbekistan. The study examines the role of innovative financial mechanisms - such as sovereign and corporate green bonds, regional cooperation, and blended financing approaches - in financing green projects. In addition, the article offers scientifically grounded practical recommendations for the implementation and advancement of the green economy and green financing framework in Uzbekistan. The findings of the study can be applied to enhance political and financial mechanisms aimed at ensuring sustainable development and promoting environmental investments.

Keywords: green finance, green bonds, sustainable development, environmental investments, ESG principles, innovative financing.

Аннотация: Статья представляет собой всесторонний теоретический и практический анализ необходимости и значимости «Зеленого» финансирования. В работе приведены статистические данные о развитии мирового рынка «Зеленых» облигаций, а также об эволюции системы «зеленого» финансирования в Узбекистане. Исследование рассматривает роль инновационных финансовых механизмов - таких как суверенные и корпоративные «Зеленые» облигации, региональное сотрудничество и смешанные подходы к финансированию - в поддержке «Зеленых» проектов. Кроме того, статья предлагает научно обоснованные практические рекомендации по внедрению и развитию «Зеленой» экономики и системы «Зеленого» финансирования в Узбекистане. Результаты исследования могут быть использованы для совершенствования политических и финансовых механизмов, направленных на обеспечение устойчивого развития и стимулирование экологических инвестиций.

Ключевые слова: зеленое финансирование, зеленые облигации, устойчивое развитие, экологические инвестиции, принципы ESG, инновационное финансирование.

INTRODUCTION

Global climate change and escalating environmental challenges are compelling countries worldwide to introduce financial mechanisms that harmonize economic development with environmental sustainability. In this context, green finance is regarded as a strategic financial instrument aimed at

reducing greenhouse gas emissions, enhancing energy efficiency, ensuring the rational use of natural resources, and financing environmentally sustainable projects alongside economic growth.

In recent years, green finance instruments - particularly green bonds and environmental loans - have experienced rapid expansion in global financial markets. According to the results of 2024, the global green bond market exceeded USD 2.9 trillion, with annual issuance reaching approximately USD 700 billion, representing nearly a sixfold increase compared to 2018. Furthermore, in the first half of 2025, the total volume of the sustainable debt market (including green, social, sustainability, and sustainability-linked debt instruments) reached USD 6.2 trillion, reflecting strong and sustained investor demand for sustainable financial assets.

However, in 2025, a decline in overall green bond issuance was observed in several regions, particularly in parts of Europe and North America, where issuance volumes decreased due to global political and regulatory uncertainties that slowed market activity. As a result, global green bond issuance declined by approximately 32% in 2025, highlighting the sensitivity of the green finance market to macroeconomic and institutional conditions. At the same time, countries such as China have maintained global leadership by issuing a record USD 70.3 billion in certified green bonds in 2025, thereby reinforcing their dominant position in the global green finance landscape.

Uzbekistan is also aligning with global trends by taking significant steps toward the development of a green economy and green financing system. In 2023, the country issued its first sovereign green Eurobonds amounting to UZS 4.25 trillion (approximately USD 660 million) through the London Stock Exchange, marking the first such issuance in the CIS region. In 2024, corporate-level green bonds totaling UZS 50 billion (approximately USD 4 million) were issued. Moreover, in 2025, Uzbekistan successfully placed sovereign international bonds in global markets with a total equivalent value of USD 1.5 billion.

International financial institutions - such as the World Bank and the Asian Infrastructure Investment Bank - play a crucial role in financing environmental projects and supporting Uzbekistan's green transformation by mobilizing investment resources. In addition, by 1 December 2025, the country plans to develop a national green financing program and establish a Green Economy Fund, further strengthening institutional support for sustainable development.

The primary objective of this article is to analyze innovative mechanisms of green financing, examine their role in enhancing economic and environmental efficiency, and develop practical recommendations to address existing challenges and policy gaps in Uzbekistan. This study contributes to the effective development of the national green finance system, the promotion of environmental sustainability, and the enhancement of the country's socio-economic impact.

Literature Review

The concept of green finance has been analyzed in academic literature from various theoretical and methodological perspectives. R. Sandor (1992) was among the first scholars to introduce the term green finance, defining it as a financial mechanism aimed at financing projects focused on combating climate change and protecting the environment [1]. Similarly, S. Kothari (Kosla) et al. conceptualize green finance as investment resources directed toward sustainable development, environmentally friendly products, the reduction of industrial pollution, and the conservation of biodiversity [2]. U. Volz and his colleagues emphasize that green finance encompasses all forms of investment and lending activities that generate a positive environmental impact [3].International organizations have also provided authoritative interpretations of the green finance concept. According to the

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-12

Organisation for Economic Co-operation and Development (OECD), green finance refers to the mobilization of financial resources to reduce greenhouse gas emissions, control waste, and promote the efficient use of natural resources while sustaining economic growth. In addition, the United Nations Environment Programme (UNEP) and the World Bank highlight the critical role of financing environmental projects in achieving sustainable development objectives [4,5,6]. Studies conducted by both domestic and foreign economists indicate that green finance does not have a universally accepted definition. Chinese scholars Ch. Chuan Li and Ch. Chiang Li argue that while identifying a single definition of green finance is challenging, the concept broadly includes climate finance, environmental risk management, and the promotion of green investments [7].

The development of the green finance concept can be broadly categorized into three main directions:

1. Environmental protection–oriented financial services, including resource efficiency, pollution control, and the financing of environmental projects;
2. Financial innovation, such as green loans, environmental bonds, insurance products, and other instruments aimed at mitigating environmental risks;
3. Promotion of green investments, through climate-related lending, securities, carbon finance, and other financial tools that contribute to sustainable development.

In the context of China's experience, the core elements of green financing include pilot zones, green credit mechanisms, public–private partnership funds, green bonds, environmental insurance, and environmental credit trading systems [8,9]. For instance, by 2018, investments in environmental projects in China contributed to a reduction of approximately 46.5 million tons of greenhouse gas emissions. Furthermore, mandatory disclosure requirements regarding environmental risks and the activities of environmentally harmful enterprises have been introduced, strengthening financial oversight and transparency.

In Uzbekistan, research on the development of the green finance system remains relatively limited; however, in recent years, local economists have begun to address this topic more actively. In particular, academic studies have focused on financing environmental projects through green bonds and green loans, as well as strengthening cooperation between the public and private sectors.

Overall, existing research suggests that green finance encompasses sustainable development, low-carbon economic growth, resource efficiency, and the promotion of environmental investments. Moreover, this concept is increasingly being implemented by financial institutions at both national and global levels, creating favorable conditions for the formation of a green finance ecosystem in developing countries such as Uzbekistan.

Analysis and Results

The concepts of green finance and the green economy are closely interconnected, with their primary objective being the achievement of sustainable economic growth alongside environmental protection. Global experience demonstrates that green finance instruments—such as green bonds, environmental loans, green insurance, and public–private partnership (PPP) projects—serve as effective mechanisms for enhancing both environmental and economic efficiency.

By the end of 2024, the global green bond market reached approximately USD 2.9 trillion, with annual issuance totaling around USD 700 billion, representing a sixfold increase compared to 2018 (LSEG, 2024). According to data from the first half of 2025, the global sustainable debt market - including green, social, sustainability, and sustainability-linked instruments - expanded to USD 6.2

VOLUME-5, ISSUE-12

trillion. However, due to political and regulatory uncertainties, total green bond issuance declined by approximately 32% during this period (Reuters, 2025).

Despite these challenges, China maintained its leading position in the global market by issuing USD 70.3 billion in certified green bonds in 2025 (FT, 2025). In contrast, green bond issuance in European and North American markets experienced a decline, primarily driven by regulatory changes and heightened geopolitical uncertainty.

Uzbekistan has made notable progress in developing its green finance framework. In 2023, the country issued its first sovereign green Eurobonds amounting to UZS 4.25 trillion (approximately USD 660 million) through the London Stock Exchange, becoming the first country in the CIS region to undertake such an issuance. In 2024, corporate green bonds totaling UZS 50 billion (approximately USD 4 million) were introduced. By 2025, the total volume of green financing in Uzbekistan reached approximately USD 1.5 billion (UZA, 2025).

A national program aimed at developing the green finance system is expected to be finalized by December 2025. In addition, cooperation with international financial institutions - such as the World Bank and the Asian Infrastructure Investment Bank (AIIB) - is anticipated to attract approximately USD 200 million in financing for environmental projects, thereby accelerating the country's green transformation.

a) Green Bonds. The experiences of Uzbekistan and China indicate that green bonds represent one of the most effective instruments for mobilizing investment into environmental projects. In China, by 2018, green bond issuance reached USD 36.2 billion, accounting for approximately 39% of total global green bond issuance.

b) Green Loans and Environmental Insurance. The experiences of both China and Uzbekistan demonstrate that green loans play a critical role in promoting resource efficiency, environmental protection, and the transition to a low-carbon economy. In 2025, the volume of green loans in Uzbekistan is projected to reach approximately USD 150 million.

c) Public–Private Partnerships and Green Funds In China, the Clean Development Mechanism Fund (CDMF) invested in 223 environmental projects, contributing to a reduction of approximately 46.5 million tons of greenhouse gas emissions. Similar regional green funds are planned to be established in Uzbekistan to support environmentally sustainable initiatives.

The analysis indicates that green finance not only facilitates the mobilization of financial resources for environmental projects but also contributes to enhancing social and economic stability. The green finance ecosystem is grounded in ESG (Environmental, Social, Governance) principles, which promote environmental protection, social development, and strengthened corporate governance, thereby contributing to sustainable development.

The results suggest that, under Uzbekistan's conditions, the green finance system can be particularly effective in the following areas:

- Adapting global green finance instruments to national economic conditions;
- Strengthening cooperation between the public and private sectors;
- Integrating sustainable development and ESG standards into financing processes;
- Expanding collaboration with international financial institutions in financing environmental projects.

Conclusion and Recommendations

The results of this study indicate that green finance is emerging as an effective mechanism at both global and national levels, integrating economic growth with environmental protection and sustainable development objectives. The importance of green finance instruments in global financial markets continues to increase: by 2024, the global green bond market reached approximately USD 2.9 trillion, with annual issuance totaling around USD 700 billion. However, in 2025, political and regulatory uncertainties caused a 32% decline in green bond issuance, highlighting the sensitivity of the green finance market to economic stability and the political environment.

In the context of Uzbekistan, the green finance system is gradually taking shape. Between 2023 and 2025, the following results were observed: sovereign green bonds amounting to USD 660 million, corporate green bonds totaling USD 4 million, and funds mobilized from international financial institutions reaching approximately USD 200 million. These financial inflows support the country's green transformation, facilitate the financing of environmental projects, and promote the transition to a low-carbon economy.

Analysis indicates that, although the term green finance does not have a universally accepted definition, it generally refers to financial mechanisms aimed at climate adaptation, environmental risk management, and the promotion of sustainable development. The green finance ecosystem is structured around ESG (Environmental, Social, Governance) principles, integrating environmental, social, and governance dimensions into a cohesive framework.

To effectively develop Uzbekistan's green finance system and align it with international best practices, the following recommendations are proposed:

Strengthening the National Legal and Regulatory Framework:

Develop unified regulatory documents for green finance instruments, including green bonds, green loans, and environmental insurance;

Integrate ESG and sustainable development standards into the national financial system.

Promoting Public–Private Partnerships (PPP):

- Enhance cooperation between public and private sectors in financing environmental projects;
- Establish regional green funds and manage them based on international best practices.

Expanding Collaboration with International Financial Institutions:

- Attract investments from institutions such as the World Bank, the Asian Infrastructure Investment Bank, and others;
- Align the green bond and loan market with international standards.

Introducing Financial Instruments and Innovations:

- Develop the green bond and green loan market;
- Manage environmental risks through instruments such as environmental insurance, carbon finance, and other innovative tools.

Establishing Monitoring Systems for Sustainable Development and the Green Economy:

- Evaluate mobilized funds and their effectiveness using statistical indicators;
- Regularly analyze the social, economic, and environmental impacts of green finance projects.

Implementing these recommendations will enable Uzbekistan to develop a robust green finance system, ensure environmental and economic sustainability, enhance socio-economic benefits, and accelerate the transition to a low-carbon economy.
