Abstract

This article discusses the development of a scientific and methodological model for implementing a differentiated approach based on the use of pedagogical software tools in secondary schools. The relevance of the problem of heterogeneity in students' knowledge levels, abilities, and needs in the educational process is substantiated. The theoretical foundations of the model include C.A. Tomlinson's concept of differentiated instruction, as well as the analysis of hybrid education by M. Lebrun and flipped classroom technologies by J. Soussi. Foreign software tools such as Diffit, Curipod, Maple Learn, Penda Learning, and the EvidenceB platform are analyzed for the practical application of the model. The model consists of four components: targeted, organizational-technological, diagnostic-resultative, and managerial. The model's effectiveness is assessed through improved student knowledge quality, motivation, and independence, as well as savings in teachers' time budgets.

Keywords: differentiated instruction, pedagogical software, scientific and methodological model, digital technologies, artificial intelligence, flipped classroom, personalization, inclusive education, adaptive learning.

1. INTRODUCTION

In the current era of globalization and digital transformation, one of the most important tasks facing the education system is to create a learning environment that matches the individual characteristics, needs, and capabilities of each student. In a modern school, students with different levels of knowledge, belonging to different national and linguistic groups, and possessing different abilities and psychological characteristics (heterogeneous classes) study in one classroom. Under such conditions, the traditional «one size fits all» approach is ineffective and negatively impacts the quality of education.

International experience shows that one of the reasons for American students' low performance in international assessment programs like PISA (Programme for International Student Assessment) is the lack of adaptation of education to each student's individual path . This problem is also relevant for Uzbekistan, and the «Uzbekistan – 2030» strategy identifies ensuring quality education and introducing digital technologies and innovative methods into the educational process as a priority task.

Differentiated instruction means offering different paths for students with varying levels of preparedness to achieve the same goal . The main problem with this approach is that its implementation requires a significant amount of effort and time. Many studies (Pozas et al., 2022) show that the need to implement a differentiated approach is one of the main causes of stress and "professional burnout" syndrome among teachers .

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 10.25 / 2025

From this perspective, modern pedagogical software tools, especially platforms based on artificial intelligence (AI) technologies, can provide invaluable assistance to teachers in implementing a differentiated approach quickly, easily, and efficiently. For example, the Diffit AI tool can adapt a single text to 4 different reading levels in 90 seconds . The Maple Learn platform adapts mathematical problems based on the student's response and displays a detailed solution .

The purpose of this article is to develop a scientific and methodological model of differentiated instruction based on the use of pedagogical software tools and to substantiate its effectiveness. International experience, particularly advanced technologies used in European and US schools (Navigated Learning, EvidenceB, EdREC), was analyzed in creating the model .

2. LITERATURE REVIEW (THEORETICAL FOUNDATIONS)

The founder of the theory of differentiated instruction is the American scholar Carol Ann Tomlinson. According to her definition, differentiation is not about approaching each student individually, but about creating different opportunities (paths) to achieve the same goal . Tomlinson identifies four main elements of differentiation: content (what the student learns), process (how the student learns), product (how the student demonstrates their knowledge), and the learning environment .

In the European educational space, the concept of hybrid learning (Marcel Lebrun) is widespread. According to Lebrun, pedagogical hybridization means ensuring active and consistent learning by students through the combination of traditional and digital resources, synchronous and asynchronous activities . In this approach, the flipped classroom technology is particularly important, where students get acquainted with the new topic at home (via video lessons), and in class, they engage in practical exercises and solve problematic situations.

Research conducted by Van Geel and colleagues (2019) showed that the key to successful differentiation is not the application of strategies, but identifying students' individual needs and adapting instruction in real-time based on that . This, in turn, requires constant diagnosis and rapid feedback.

Advances in artificial intelligence and data science have taken differentiated instruction to a new level. According to the "Navigated Learning" concept developed by Nancy B. Songer and co-authors (2019), modern platforms can collect and analyze students' cognitive (knowledge) and non-cognitive (motivation, interest) data in real-time and offer the teacher an individual trajectory for each student . The main components of these platforms are: a competency model (e.g., Navigator Competency Model), a Learning Data Backbone, and applications tailored for different users (teacher, student, administrator).

Research in cognitive sciences also substantiates the effectiveness of the differentiated approach. For example, the adaptive modules of the French platform EvidenceB are based on the latest achievements in cognitive sciences, using artificial intelligence algorithms to identify and fill students' knowledge gaps .

The literature analysis shows that differentiated instruction based on the use of pedagogical software tools not only improves the quality of students' knowledge but also reduces teachers' workload and encourages them to engage in creative pursuits . However, the success of this process largely depends on teachers' digital competencies (TPACK) and their ability to critically evaluate technologies .

3. RESEARCH METHODOLOGY

In this study, the theoretical-conceptual modeling method plays a central role. The following stages were implemented in developing the scientific-methodological model:

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 10.25 / 2025

1. **Theoretical Analysis:** International and local scientific literature, dissertations, and methodological manuals in the fields of differentiated instruction, hybrid learning, and digital technologies were analyzed (Tomlinson, Lebrun, Songer, et al.).
2. **Studying Advanced Foreign Experience:** The functional capabilities and pedagogical impact of modern pedagogical software tools (Diffit, Curipod, Maple Learn, Penda Learning, EvidenceB, i-Ready, EdREC) used in schools in the USA and Europe (Belgium, France) were studied .
3. **Conceptual Modeling:** Based on the analysis results, a scientific-methodological model of differentiated instruction based on the use of pedagogical software tools was designed. The structural components (blocks) of the model and the interrelationships between them were determined.
4. **Synthesis and Generalization:** Various technological and pedagogical approaches were synthesized and brought into a single system. Recommendations for the practical application of the model were developed.

4. MODEL OF DIFFERENTIATED INSTRUCTION BASED ON PEDAGOGICAL SOFTWARE TOOLS

The developed scientific-methodological model consists of four interconnected components: targeted, organizational-technological, diagnostic-resultative, and managerial.

4.1. Targeted Component

The goal of the model is to improve students' educational outcomes (knowledge, skills, competencies) and develop their ability for independent learning by implementing a differentiated approach in secondary schools through pedagogical software tools.

Tasks of the model:

- To identify the individual characteristics of each student (knowledge level, learning pace, interests, language barriers).
- To adapt the content (text, exercises) to the capabilities of students using various software tools.
- To create opportunities for students to work independently on an individual trajectory.
- To provide the teacher with information about students' progress in real-time and create conditions for providing prompt assistance when necessary.
- To meet the needs of special categories of children, such as those in inclusive education, English Language Learners (ELL), and gifted students.

4.2. Organizational-Technological Component

This component forms the basis of the model and consists of two parts: pedagogical strategies and a set of software tools.

Pedagogical Strategies:

1. **Flipped Classroom Technology:** Learning new material is given as homework (via short videos). In class, practical exercises, projects, and problematic situations are addressed. This strategy allows the teacher more time for individual work with each student in the classroom.
2. **Navigated Learning:** In this strategy, students move towards a single goal via different paths. The platform offers appropriate resources (video, text, exercises) based on the student's difficulties .
3. **Providing Multiple Modalities:** To study the same topic, students are offered various formats: text (at different levels), video, audio, interactive simulations (e.g., PhET).

VOLUME-6, ISSUE-2

4. **Adaptive Exercises:** The complexity of the next exercise automatically changes based on the student's responses.

Set of Pedagogical Software Tools:

Table 1.

Classification of Pedagogical Software Tools in the Model

Tool Name	Primary Function	Differentiation Capabilities
Diffit	Text Adaptation	Adapts any text to 4+ reading levels, translates into 75+ languages, generates questions and key vocabulary .
Curipod	Creating Interactive Lessons	Creates interactive slides, polls, drawing tasks on a topic in 60 seconds. Increases lesson engagement .
Maple / Maple Learn	Mathematical Modeling	Automatically generates problems at varying difficulty levels, shows detailed solutions, creates visual aids .
Penda Learning	Science Education	Offers science activities at 2 reading levels, text-to-speech, translation into 60+ languages, gamification .
EvidenceB (Adaptiv'Math)	Adaptive Mathematics	Creates an individual path for each student based on AI, exercises based on cognitive science, detailed dashboard for the teacher .
Learning Navigator (Gooru)	Competency-Based Platform	Collects real-time data, identifies student gaps, recommends appropriate resources .

4.3. Diagnostic-Resultative Component

A system for diagnosis and evaluation of results has been developed to determine the effectiveness of the model.

Types of Diagnosis:

1. **Initial (Entry) Diagnosis:** The level of student preparedness is determined before starting a new topic (tests, questionnaires, initial tasks on the platform). For example, the EvidenceB platform has a "placement test" .
2. **Ongoing (Formative) Assessment:** Carried out continuously during the learning process. Whether the student understands or not is checked in real-time through pedagogical software tools (polls in Curipod, exercises in Maple Learn, questions in Diffit).
3. **Final (Summative) Assessment:** A test, control work, or project conducted at the end of a topic or chapter.

Evaluation Criteria:

- **Quality of Knowledge:** Average score on tests, reduction in the number of errors.

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 10.25 / 2025

- **Student Activity:** Participation in the lesson (e.g., an increase in the participation rate from 45% to 88% in Curipod has been noted).
- **Level of Independence:** The student's ability to solve problems and work independently on the platform without teacher assistance.
- **Motivation:** Interest in the subject, satisfaction with the lesson (determined through surveys).
- **Teacher's Time Budget:** Reduction in time spent preparing for lessons (e.g., 3 hours of work with Diffit reduced to 15 minutes).

4.4. Managerial Component

The managerial component plays a crucial role for the successful operation of the model. This component is based on the teacher's activity and includes the following:

1. **Planning:** Determining which software tool will be used, when, and for what purpose. For example, it is recommended to use Diffit mainly for working with complex texts (in 20% of lessons) and Curipod for daily lessons (80%) .
2. **Monitoring:** Tracking the progress of each student and the class through the dashboards of pedagogical software tools. Penda Learning, EvidenceB, and Gooru platforms offer extensive capabilities in this regard .
3. **Analysis and Decision Making:** Based on monitoring results, determining who needs additional help and who should be given more complex tasks. Platforms like i-Ready provide recommendations based on data .
4. **Correction:** Organizing group or individual work to eliminate identified deficiencies.
5. **Collaboration:** Maintaining constant communication with students through platforms like Microsoft Teams, helping them with homework, and answering questions .

(The diagram illustrates the interrelationship of the targeted, organizational-technological, diagnostic-resultative, and managerial blocks.)

5. DISCUSSION AND CONCLUSION

The developed scientific-methodological model enables the systematic organization of a differentiated approach based on the use of pedagogical software tools. The analysis shows that modern digital tools (AI-based platforms) are very effective in solving the problem of time and labor resources, which is the biggest obstacle to differentiation. Specifically, tools like Diffit or Maple Learn can create dozens of tasks at different levels within a few minutes.

The main pedagogical advantages of the model:

- **Inclusivity:** The model allows children who speak other languages, have dyslexia, or have low preparedness to learn together with the general class without being isolated .
- **Increased Motivation:** Gamification elements in Curipod and Penda Learning, and PhET simulations make the lesson interesting and increase student engagement .
- **Precision:** Data-driven instruction allows the teacher to work based on specific numbers, not just "intuition" or "experience."
- **Time Efficiency:** The teacher is freed from routine tasks (rewriting the same text, creating exercises) and can allocate time to creative activities .

However, the successful implementation of the model also depends on several conditions:

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889, 2024-6.875 ResearchBib IF: 10.25 / 2025

1. **Teachers' Digital Competence (TPACK):** Educators need not only to know the technology but also to be able to critically evaluate and apply it in accordance with pedagogical goals . AI tools can provide incorrect or biased information, so teacher oversight is necessary.
2. **Technical Infrastructure:** Availability of high-speed internet, modern computers, and tablets in schools.
3. **Methodological Support:** Organizing continuous professional development courses, webinars, and methodological guides for teachers.

In conclusion, the model of differentiated instruction based on pedagogical software tools is a promising way to solve complex problems of modern education, such as heterogeneity, inclusivity, and quality education. To implement this model in the context of Uzbekistan, it is necessary to increase content in local languages, localize existing platforms, and improve the teacher training system.
