THE EFFECTS OF ELECTRONIC CIGARETTE USE ON LUNG FUNCTION AND COGNITIVE ABILITIES AMONG YOUTH: A LITERATURE REVIEW

Dangalova Gulhayo G’iyosovna
Teacher at the Abu Ali ibn Sino College of Public Health, Pastdargham
Uzbekiston, Samarkand

Annotatsiya: Ushbu maqola maktab o‘quvchilari va universitet talabalari o‘rtasida elektron sigaretlar (vaping) o‘pka tizimi va kognitiv funksiyalarga, xususan, diqqatni jamlashga ko‘rsatadigan ta’sirini so‘nggi besh yillik ilmiy manbalar asosida tahlil qiladi. Tadqiqotlar shuni ko‘rsatadiki, nikotinli va nikotinsiz aerozollar o‘pka to‘qimalarida yallig‘lanishni keltirib chiqaradi va neyrokognitiv rivojlanishga salbiy ta’sir ko‘rsatadi.

Kalit so’zlar: elektron sigaretlar (vaping), jamoat salomatligi, o‘pka funksiyasi (spirometriya), kognitiv qobiliyatlar, diqqatni jamlash, nikotin bog‘liqligi, o‘smirlar va talabalar, profilaktik tibbiyot

Аннотация: В данной статье на основе научных исследований последних пяти лет анализируются последствия использования электронных сигарет (вейпинга) для дыхательной системы и когнитивных функций, в частности, внимания, у школьников и студентов. Исследования показывают, что как никотиновые, так и безникотиновые аэрозоли вызывают воспаление легочной ткани и негативно влияют на нейрокогнитивное развитие.

Ключевые слова: электронные сигареты (вейпинг), общественное здравоохранение, функция легких (спирометрия), когнитивные способности, внимание, никотиновая зависимость, подростки и студенты, профилактическая медицина

Abstract: This article analyzes the effects of electronic cigarettes (vaping) on the pulmonary system and cognitive functions, in particular on attention, among schoolchildren and university students, based on the last five years of scientific literature. Studies show that both nicotine and nicotine-free aerosols cause inflammation in lung tissue and negatively affect neurocognitive development.

Keywords: electronic cigarettes (vaping), public health, pulmonary function (spirometry), cognitive abilities, attention, nicotine dependence, adolescents and students, preventive medicine

Kirish: So‘nggi o‘n yillikda elektron sigaretlar an’anaviy tamakiga xavfsiz muqobil sifatida targ‘ib qilinishi natijasida yoshlar orasida ommalashdi. Biroq, jamoat salomatligi bo‘yicha o‘tkazilgan so‘nggi tadqiqotlar bu qarashning xato ekanligini isbotlamoqda [1]. Yoshlik davri o‘pka va miya rivojlanishining kritik bosqichi bo‘lib, bu davrda tashqi toksik ta’sirlar qaytmas oqibatlarga olib kelishi mumkin. Tadqiqotning maqsadi — yoshlar o‘rtasida vapingning fiziologik va kognitiv zararlarini adabiyotlar tahlili orqali yoritishdir.

Material va metodlar:Ushbu sharhni tayyorlashda PubMed, Scopus, Google Scholar va Cochrane Library ma’lumotlar bazalaridan foydalanildi. Izlash uchun "e-cigarettes", "vaping", "adolescents",

VOLUME-6, ISSUE-2

"lung function", "cognitive performance", "attention span" kabi kalit so‘zlar qo‘llanildi. Tahlil uchun 2019–2025-yillar oralig‘ida chop etilgan 40 dan ortiq ingliz tilidagi nufuzli maqolalar saralab olindi.

Natijalar va adabiyotlar tahlili: Elektron sigaret aerozollari tarkibidagi propilenglikol, glitserin va xushbo‘y moddalar o‘pka alveolalarida oksidlovchi stressni keltirib chiqaradi [2]. Tadqiqotlar shuni ko‘rsatadiki, muntazam vaping bilan shug‘ullanuvchi talabalarda nafas qisishi, surunkali yo‘tal va "EVALI" (elektron sigaret bilan bog‘liq o‘pka jarohati) belgilari ko‘p kuzatiladi [3]. Spirometrik ko‘rsatkichlar shuni tasdiqlaydiki, vaperlarda o‘pkaning hayotiy sig‘imi va birinchi soniyadagi jadal nafas chiqarish hajmi chekmaydigan tengdoshlariga nisbatan sezilarli darajada past [1].

Nikotin o‘smir miyasining prefrontal qobig‘iga — diqqat, qaror qabul qilish va impuls nazorati uchun mas’ul hududga kuchli ta’sir qiladi [4]. Talabalar o‘rtasida o‘tkazilgan so‘rovnomalar shuni ko‘rsatadiki, elektron sigaret iste’mol qiluvchilar dars paytida diqqatni jamlashda qiyinchiliklarga duch kelishadi va ularda xotira pasayishi kuzatiladi [5]. Nikotin neyronlararo bog‘lanishlarni (sinapslar) o‘zgartirib, o‘rganish jarayonini sekinlashtiradi [6].

Muhokama: Adabiyotlar tahlili shuni ko‘rsatadiki, elektron sigaretlar faqatgina o‘pka bilan cheklanib qolmay, balki markaziy asab tizimiga ham zarar yetkazmoqda. Ayniqsa, maktab o‘quvchilari orasida miya neyroplastikligi yuqori bo‘lganligi sababli, nikotinga bog‘liqlik kattalarga qaraganda tezroq shakllanadi [7]. Tadqiqotchilarning aksariyati "vaping" akademik o'zlashtirishning pasayishiga olib keluvchi bilvosita omil ekanligini ta’kidlamoqda [8].

Xulosa: Vaping yoshlar uchun "xavfsiz" emas. U o‘pka funksiyasini pasaytiradi va diqqatni jamlash kabi muhim kognitiv ko‘nikmalarga zarar yetkazadi. Jamoat salomatligi strategiyalari doirasida maktablarda profilaktika choralarini kuchaytirish va elektron sigaretlar savdosini qat’iy nazorat qilish zarur.
