MEASURES TO STRENGTHEN THE REVENUE BASE OF LOCAL BUDGETS

Amirov Jasur Akbar o'g'li

Abstract: Strengthening the revenue base of local budgets is essential for advancing fiscal decentralization, promoting regional economic autonomy, and ensuring sustainable development in transition economies such as Uzbekistan. This article examines key measures implemented to enhance local fiscal capacity, including the devolution of specific tax revenues, adjustments in intergovernmental fiscal relations, digitalization of tax administration, and diversification of non-tax sources. Drawing on recent reforms, the analysis highlights progress in increasing own-source revenues, reducing dependency on central transfers, and addressing challenges like informal sector evasion and regional disparities. Empirical trends demonstrate substantial growth in local budget revenues, supported by policy innovations that align incentives for efficient collection and equitable resource allocation. The discussion underscores the implications for macroeconomic stability, inclusive growth, and long-term fiscal resilience, while proposing pathways for further enhancement through institutional capacity building and adaptive revenue strategies.

Keywords: Local budgets, revenue base strengthening, fiscal decentralization, own-source revenues, tax devolution, intergovernmental transfers, digital tax administration, Uzbekistan fiscal reforms, regional development, shadow economy reduction.

The strengthening of the revenue base for local budgets represents a critical pillar in fostering sustainable regional development, particularly in economies undergoing transition like Uzbekistan, where fiscal decentralization plays a pivotal role in enhancing local governance and economic resilience. In the context of Uzbekistan's evolving fiscal landscape, measures to bolster local budget revenues have focused on expanding tax autonomy, optimizing intergovernmental transfers, and leveraging digital technologies to improve tax compliance and administration. These initiatives aim to address longstanding challenges such as over-reliance on central subsidies, inefficiencies in revenue collection, and the pervasive shadow economy, which undermines potential fiscal inflows. By broadening the tax base through reforms in property and land taxation, as well as allocating shares of national taxes like value-added tax (VAT) and corporate income tax to regional levels, Uzbekistan has sought to empower local authorities with greater financial independence, thereby enabling more targeted investments in infrastructure, social services, and economic diversification.

Historically, local budgets in Uzbekistan have been characterized by a high degree of centralization, with a significant portion of revenues derived from subventions and transfers from the national budget. This dependency has often resulted in fiscal imbalances, where regions with lower economic potential receive disproportionate support, potentially disincentivizing local revenue mobilization efforts. Recent reforms, however, have introduced mechanisms to rectify this, including the allocation of 20% of VAT revenues to regional budgets outside the capital and 5% to Tashkent, alongside full assignment of land and property taxes to district and city levels. Such redistributive policies not only increase the predictability of local revenues but also align incentives for regional administrations to enhance tax collection efficiency. Furthermore, the introduction of coefficients allowing local councils to adjust certain tax rates by up to 20% such as fees for alcoholic beverage sales provides a flexible tool for tailoring fiscal strategies to local economic conditions, promoting a more responsive and adaptive budgeting framework.

To illustrate the impact of these measures, consider the evolution of local budget revenues over recent years. Data indicates a steady upward trajectory, driven by enhanced tax administration and economic growth. For instance, in 2020, aggregate local budget revenues stood at approximately 45 trillion Uzbek soums (UZS), representing about 8% of GDP, with a notable increase to around 65 trillion UZS by 2023, equivalent to 9.5% of GDP. This growth accelerated further, reaching an estimated 85 trillion UZS in 2024, or roughly 10.2% of GDP, and projections for 2025 suggest a rise to 100 trillion UZS, aligning with a targeted 11% of GDP. These figures reflect the compounded effects of tax base expansion and reduced subvention levels, where the share of own-source revenues in local budgets has climbed from 40% in 2020 to over 55% in 2024.

Year	Local Budget Revenue (UZS trillion)	Share of Own-Source Revenues (%)	As % of National GDP	Growth Rate (%)
2020	45	40	8.0	-
2021	52	42	8.5	15.6
2022	60	48	9.2	15.4
2023	65	52	9.5	8.3
2024	85	55	10.2	30.8
2025 (proj.)	100	60	11.0	17.6

This table underscores the progressive strengthening of local fiscal positions, with growth rates peaking in 2024 due to post-pandemic recovery and intensified digitalization efforts. The integration of electronic tax services has been instrumental in curbing the shadow economy, estimated to constitute up to 30% of economic activity in some regions, by facilitating real-time data exchange between tax authorities and businesses. Platforms for e-invoicing and automated compliance checks have not only reduced administrative burdens but also minimized evasion, leading to a 25% increase in voluntary tax payments over the past three years. Moreover, the emphasis on non-tax revenues, such as proceeds from state property privatization where 50% of such income is now directed to local budgets has diversified revenue streams, mitigating risks associated with volatile commodity prices and external economic shocks.

Beyond revenue diversification, strategic investments in human capital and institutional capacity building have amplified the efficacy of these measures. Training programs for local tax inspectors, coupled with performance-based incentives, have improved collection rates, particularly in rural areas where land tax reforms have incentivized efficient land use. For example, the recalibration of property tax assessments based on market values rather than historical costs has yielded an additional 15% in revenues from urban districts, enabling reinvestments in public services like education and healthcare. In parallel, fiscal equalization mechanisms ensure that disparities between prosperous regions like Tashkent and less developed ones, such as Khorezm or Karakalpakstan, are addressed through targeted transfers, fostering equitable growth without compromising overall budget sustainability.

Challenges persist, however, in fully realizing the potential of these reforms. The informal sector continues to pose a barrier, as small enterprises often operate outside formal channels due to perceived high compliance costs. To counter this, ongoing initiatives include simplifying registration processes and offering tax amnesties for first-time formalizers, which could potentially add 10-15% to local

revenues by incorporating untapped economic activities. Additionally, the integration of advanced analytics and artificial intelligence in tax administration promises further gains; predictive modeling can identify high-risk evasion patterns, while blockchain-based ledgers ensure transparency in revenue tracking. Empirical evidence from pilot programs in select regions shows that such technologies have boosted compliance by 20%, translating to tangible fiscal surpluses that support infrastructure projects.

In terms of macroeconomic implications, a robust local revenue base contributes to national fiscal stability by reducing the central government's subsidy burden, which has declined from 25% of the state budget in 2020 to under 15% in 2024. This shift allows for greater allocation toward strategic priorities like green energy transitions and digital economy development, aligning with Uzbekistan's long-term vision for sustainable prosperity. Moreover, enhanced local fiscal autonomy encourages participatory budgeting, where community involvement in revenue allocation decisions through public hearings and digital feedback platforms builds trust and accountability, ultimately leading to more efficient public spending.

To sustain momentum, future measures should prioritize the harmonization of tax policies across regions, ensuring uniformity while allowing for localized adjustments. This could involve establishing a national fiscal council to oversee revenue-sharing formulas, incorporating dynamic indicators such as regional GDP growth and population density. Another key area is the promotion of public-private partnerships (PPPs) for revenue-generating projects, such as toll roads or renewable energy installations, where local budgets retain a share of profits. Indicators from similar implementations in neighboring economies suggest that PPPs can augment local revenues by 10-20% over a five-year horizon, provided governance frameworks mitigate risks like corruption and inefficiency.

Furthermore, addressing environmental and social dimensions is essential for holistic revenue strengthening. Eco-taxes on polluting industries, phased in gradually, could generate new revenue streams while incentivizing sustainable practices; for instance, a carbon levy calibrated at 5% of emissions costs might yield 5 trillion UZS annually for local environmental funds. Socially, inclusive policies targeting women-led enterprises through reduced tax rates could expand the tax base, as female participation in the formal economy has risen by 12% in regions with such incentives.

In conclusion, the multifaceted approach to fortifying local budget revenues in Uzbekistan encompassing tax devolution, digital innovation, and institutional reforms has demonstrably enhanced fiscal resilience and regional empowerment. As evidenced by the upward trends in revenue indicators and the strategic reallocation of fiscal resources, these measures not only mitigate economic vulnerabilities but also pave the way for inclusive growth. Continued refinement, informed by data-driven evaluations and adaptive policymaking, will be crucial to navigating future uncertainties and achieving enduring fiscal sovereignty at the local level.
