PSYCHOLOGICAL ASPECTS OF THE RELATIONSHIP BETWEEN EMOTIONAL INTELLIGENCE AND LEADERSHIP QUALITIES IN STUDENTS

Murotmusaev K.B.

Republic of Uzbekistan Oriental University, Department of 'Pedagogy of Continuing Education'
Candidate of Medical Sciences, Associate Professor. Tashkent, Uzbekistan.

Annotation. In article the interrelation of emotional intelligence (components of emotional intelligence) with leadership skills on the example of the students who are a part of student council is considered.

Keywords: emotional intelligence, components of emotional intelligence, leadership skills, student.

Introduction. The phenomenon of leadership has been of interest to scientists since ancient times and therefore much attention has been paid to its study to this day. This phenomenon is interesting not only from the point of view of age psychology, social psychology, labour psychology, legal psychology, but also management psychology, pedagogical psychology and others. Formulation of the purpose of the article. We all belong to different groups, and at different stages of their development and existence a leader appears.

The leader is able to influence the mood of group members, relationships, behaviour, interests and activities. But at the same time, the leader must be able to determine his emotional state and members of the group, for more successful functioning of the group, building interpersonal relationships, this contributes to the formed high level of emotional intelligence.

Researchers P. Salovey and J. Meyer in 1990, having analysed various works available at that time, one way or another related to the study and understanding of human emotions and emotional experiences of other people, introduced the concept of 'emotional intelligence'. The authors developed the construct of emotional intelligence, which includes: understanding and regulation of emotions, and building one's thinking and behaviour on this basis. Later D. Goleman added a few more components: enthusiasm, perseverance and social skills. In its final form, after revisions by the author, this construct consists of: social sensitivity, relationship management, self-awareness, self-control and eighteen skills [1].

P. Bar-On identified five components of emotional intelligence: self-knowledge, interpersonal communication skills, adaptability, stress management, prevailing mood. Recently, interest in the study of emotional intelligence in the Russian Federation has increased and this is confirmed by the works of such scientists as I.N. Andreeva, D.V. Lyusin, O.O. Maryutina, A.S. Stepanova, D.V. Ushakov.

We are close to the position of D.V. Lucin, who believes that emotional intelligence is 'the ability to recognise, understand and manage emotions' [3, p. 34]. [3, c 34]. According to the scientist, the structure of emotional intelligence is three-component and consists of: interpersonal and intrapersonal emotional intelligence, as well as the ability to manage and understand their emotions and another person. These abilities can be formed under the influence of interest not only in one's own inner world, but also in the world of another person, their interests, values and behaviour. Emotional intelligence is a complex construct manifested in cognitive abilities and personality characteristics.

Formation of emotional intelligence begins in childhood and continues throughout a person's life. It is the formed high level of emotional intelligence contributes to building quality interpersonal relations, at any age, whether it is a student group or a production team. First of all, a leader in a collective or group should have high emotional intelligence. There is no universally recognised definition of 'leader', scientists refer it to a social phenomenon that manifests itself and exists only in the conditions of the group, when solving problems and achieving a common goal, distribution of resources. A leader influences the group and ensures the realisation of group tasks, takes responsibility for himself in significant issues and situations, enjoys authority, can draw others away from him.

Researcher R. Stogdill made an attempt to combine the available definitions of leadership into groups, which included leadership as: the ability to persuade, manifestation of personality traits, power, action and behaviour, a tool for achieving a goal, etc. [2]. [2]. A group cannot exist without a leader. He is needed to settle interpersonal relations, which include personal and business spheres. It is on the leader, influencing both sides of life of any group, that the effectiveness of group interaction will depend. A leader can be both official and unofficial, but in any case, he is an authority for the members of his group, it is he who is recognised as having a decisive voice in making important decisions, organising activities and regulating relationships in the group itself.

Leadership classifications are based on the following grounds: content, nature and orientation of activity. There are also several approaches that include different theories of leadership. For example, the approach from the position of personal qualities. It is dominated by the theory in which it is believed that the leader is a person who has a certain set of qualities, abilities and skills, psychological qualities and traits (C. Baird). In the behavioural approach, preference is given to teaching effective forms of managerial behaviour (D. McGregor, K. Levin, R. Likert, etc.). In the situational theory of leadership, various situational factors are decisive for the formation of an effective leadership position, but behavioural and personal characteristics of a person are taken into account (P. Hersey and C. Blanchard).

Modern approaches are centred on the totality of all the theories accumulated in science. Despite the numerous theories of leadership, it is difficult to formulate a single definition of 'leadership' and 'leader'. Undoubtedly, leadership is a social phenomenon related to various organised groups with a certain goal in mind. In a group it is constantly necessary to solve various problems, in one way or another relevant to all members of the group. When solving a task or moving towards a common goal, there is an interaction that needs to be managed, thus, a person who takes on the functions and responsibilities of a group leader emerges or comes to the fore. We will adhere to the opinion of B. G. Meshcheryakov, who believes that leadership is the degree of leader's influence on the group for the implementation of group tasks [4].

A leader is a person who is recognised as an authoritative person, who has attractive traits, who has influence on the group, who is able to carry the group along. A leader is needed in all situations and conditions, as it is the leader who is able to regulate intra-group processes. It is the leader who is recognised as having the right to make responsible decisions in difficult and uncertain situations. The leader is able to organise any joint activity and influence relations in the group, regulate disputable situations.

Based on this, leaders are distinguished by content, nature and direction of activity. Leadership qualities are skills, abilities and certain qualities developed by a person and necessary for solving

VOLUME-5, ISSUE-1

leadership tasks and organising cooperation in a student group. Different authors refer to the following traits as the most significant ones: friendliness, enthusiasm, emotional stamina, decency.

It is necessary to dwell separately on the skills acquired by the leader, which are necessary for successful interaction with the group, they include: diplomacy, the ability to take responsibility, flexibility, the ability to persuade, the ability to be reliable, to understand humour, to gain support, to understand people, the ability to take risks, etc.

The following qualities can be attributed to the main qualities necessary for a leader: self-confidence, readiness to provide support, self-motivation, active life position, willingness to take risks, understanding of oneself, ability to create conditions for the development of one's team, initiative. Summarising the above, we can conclude that success in any business depends on the formed leadership qualities and emotional intelligence in the group leader.

This conclusion was made by D. Goleman, who paid much attention to the study of emotional intelligence. It is the leader who should have a high level of emotional intelligence, which allows him/her to understand the emotional state of another person. Emotional intelligence consists of important areas necessary for interpersonal interaction: self-awareness, social sensitivity self-control and skills in relationship management[5].

For student leaders, a developed self-awareness can help in controlling their emotions, empathy, analysis of their behaviour, self-control. Social sensitivity helps student leaders to provide help and support to first-year students who may experience problems in adapting to the university, fears, anxiety. Tactful attitude within the student community allows members of the student council to help in solving difficult situations in which students find themselves. It is the formed emotional intelligence, first of all, in the members of the student council that is the key ability to ensure quality interaction in the student environment.

Based on the above, the study was conducted with the participation of 50 people, all respondents are representatives of the student council of Jizzak branch of the National University named after M. Ulugbek. The following methods were used in the study: Emotional Intelligence Test (N. Hall method), test - questionnaire for determining emotional intelligence D. Goleman, diagnosis of leadership abilities (E. Zharikov, E. Krushelnitsky), test ‘I am a Leader’ (A.N. Lutoshkin).

Let's consider the results obtained during the application of the emotional intelligence test N. Hall. The results obtained on the scale O ‘Emotional awareness’ are as follows: the prevailing 342 number of respondents (53%) revealed a high level of emotional awareness.

The obtained results allow us to assert that the respondents have an excellent understanding of their emotions, understand the reason for their occurrence. In 27% of cases the level of emotional awareness of respondents is average, these students understand and are aware of their inner state, know how to manage and work with their emotions. Only 20 per cent of the respondents were found to have a low level of awareness.

These respondents have difficulties in identifying feelings and emotions of both their own and other students. The following results were obtained for scale S ‘Managing one's emotions’: 47% of respondents have a high level, 41% have an average level and 12% of students have a low level of expression.

The results obtained allow us to state that most students are able to manage their emotions and moods. They are resistant to external stimuli, resilient, easy to switch. Only a small number of students have difficulties in changing their emotional state, they are emotionally rigid, unable to control the external manifestation of their emotions. According to the scale F ‘Self-motivation’ it was

ISSN: 2582-4686 SJIF 2021-3.261, 2022-2.889, 2023-5.384, 2024-6.875 ResearchBib IF: 9.948 / 2024

revealed that 46% of respondents have a high level of self-motivation, 42% have an average level. These respondents are able to achieve the set goal, while controlling their mood and emotional state. In 12% of respondents low level is defined, it indicates that students with great efforts achieve the goals they set for themselves, while experiencing difficulties in the distribution of forces and ways of its achievement. These students are not able to hide their feelings when receiving a negative result, they experience negative emotions and mood for a long time.

The following results were obtained for scale A 'Empathy': 58% of respondents have an average level, 27% have a high level and 15% have a low level of empathy development. The obtained results allow us to say that most of the respondents can hardly sympathise and empathise with another student. They cannot understand the experiences of another person, do not understand his/her inner world, cannot emotionally support. Average and low levels of empathic abilities development can be an obstacle for interpersonal communication and establishing trusting relationships between people[7].

The obtained data on scale D 'Recognition of other people's emotions' are close to those described above. Only 18% of students have a high level of development of skills to recognise emotions and emotional states of other people. A significant part of respondents have average (52%) and low (30%) levels of emotion recognition.

The majority of the surveyed students can interpret and identify the internal state of another with great difficulty and are unable to adjust to it. As a result of the study of the level of development of emotional intelligence using the D. Goleman method. Goleman method the following results were obtained. The scale 'General emotional intelligence' revealed that 32% of students have a high level of emotional intelligence development.

The obtained data suggest that the respondents are able to interpret and identify not only their own emotions, but also the emotions of other students at a sufficiently high level. They have no difficulties in interpersonal communication with other students and teachers, as they interpret the mood and inner state of others. 68% of students have an average level of development of emotional intelligence. There were no students with low level of emotional intelligence development. In 23% of respondents internal emotional intelligence has a high level of development. These students are able to interpret and identify their inner experiences, are inclined to self-analysis, ability to manage their emotional state. The predominant number of respondents (77%) has an average level of development of internal emotional intelligence.

The obtained results allow us to conclude that they can listen to themselves at a sufficient level, understand their inner emotional state, adjust their emotions to the surrounding situation. No students with a low level of internal emotional intelligence development were identified[6].

The scale 'Social emotional intelligence' revealed that 15% of the subjects have a high level of development. These students are effective in interpersonal group interaction. The majority of respondents (80%) have an average level of social intelligence development.

The obtained results indicate that these students can establish interpersonal interaction, can understand another person, pay attention to non-verbal signals. Unfortunately, 5% of respondents have a low level of social intelligence. These students do not understand the experiences and emotions of other people, because of this interpersonal conflicts may arise.

The scale 'Existential Emotional Intelligence' revealed the following results, 33% of students have high level, 60% of students have average and 7% have low levels. Most students understand the

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-1

importance of developing their creative abilities, needs, emotions, but do not always make efforts to do so.

The data obtained by the method 'Diagnostics of leadership abilities' E. Zharikova and E. Zharikov and E. Krushelnitsky allows us to assert that the predominant number of students with moderately expressed leadership qualities (52%), 8% have pronounced leadership qualities, for 10% of respondents leadership is expressed by a tendency to dictate.

In general, we can conclude that leadership qualities are expressed in the majority of respondents, they are characterised by such qualities as: organisation, discipline, reliability, diplomacy, flexibility, commitment, initiative. The respondents are characterised by independence in decision-making, responsibility, risk-taking, tactfulness, participation, vigilance. They can persuade, be attentive to the members of their group, are communicative and have high adaptability. Thirty per cent of respondents have poorly expressed leadership qualities, which means that they have difficulties in decision-making, fear responsibility, lack initiative, and have difficulties in communicating with other students.

With the help of the method 'I am a leader' it was determined that the majority of students-leaders possess such skills at high and medium level as: awareness of the purpose of their activities (68% and 32%), ability to work in a group (54% and 46%), ability to influence people around them (62% and 38%), ability to manage themselves (36% and 64%), ability to solve their own problems and other students (42% and 58%), the presence of creativity (32% and 68%), the presence of formed organisational abilities (28% and 73%).

Correlation analysis (Pearson correlation coefficient r-Pearson) of the relationship between emotional intelligence and leadership qualities of students showed that there is a positive relationship between certain characteristics of emotional intelligence with leadership qualities, namely: component 343 'Self-motivation' is interrelated with the component 'Creative approach' (r=0,294; p 0,05); components 'Emotional awareness' and 'Influence on others' (r=0,443; p 0,01). A strong correlation exists between the components 'Ability to work in a group' and 'Managing own emotions' (r=0.412; p 0.01). The correlation between 'Social emotional intelligence' and 'Ability to influence others' (r=0.309; p 0.05), weak correlation between components of 'Internal emotional intelligence' and 'Ability to solve problems' (r=0.297; p 0.05) was revealed. In addition, a weak correlation was found between the components 'Internal Emotional Intelligence' and 'Ability to manage oneself' (r=0.239; p 0.05); a strong correlation between the components 'Existential Emotional Intelligence' and 'Organisational Ability' (r=0.402; p 0.01). A weak correlation between the components 'Existential emotional intelligence' and 'Ability to manage oneself' (r=0,334; p 0,05); between the components 'Existential emotional intelligence' and 'Creative approach' (r=0,327; p 0,05) was revealed.

Conclusions. The conducted correlation analysis confirmed the existence of a relationship between emotional intelligence and leadership qualities of students. In addition, the obtained results allow us to state a sufficiently high development of leadership and organisational abilities in students of student council representatives.

Despite the fact that the number of students with low level of development of emotional intelligence is insignificant and there are no students with low level of leadership qualities, the analysis of the obtained results allows us to state that it is necessary to conduct psychological work with students aimed at the development of emotional intelligence, leadership and organisational

qualities, which will contribute to building effective interpersonal relationships and, consequently, improving the quality of the student council.
