STRATEGIES FOR DEVELOPING THE PROFESSIONAL COMPETENCE OF SPEECH THERAPISTS IN INCLUSIVE EDUCATION SETTINGS

Xonbabayeva Madinabonu Asqarjon qizi
Teacher of the Kokand state pedagogical institute

Annotation. *This article explores strategies for developing the professional competence of speech therapists working in inclusive education settings. It examines the essential components of professional competence, including pedagogical, psychological, and communicative skills, as well as their role in supporting children with speech and language disorders. The study highlights modern methodological approaches, innovative technologies, and interactive teaching methods that enhance the training and effectiveness of future speech therapists. Additionally, it discusses the challenges faced in inclusive education and proposes evidence-based solutions for improving speech therapy services. The findings contribute to the advancement of logopedic education and professional development in inclusive environments.*

Keywords: *Inclusive education, speech therapy, professional competence, speech therapists, pedagogical strategies, communicative skills, methodological approaches, innovative technologies, special education, professional development*.

INTRODUCTION

Inclusive education aims to provide equal learning opportunities for all students, including those with speech and language disorders. As a result, the role of speech therapists in inclusive settings has become increasingly important. Speech therapists must possess a high level of professional competence to effectively support children with diverse linguistic and communicative needs. This competence encompasses pedagogical, psychological, and communicative skills, as well as knowledge of modern therapeutic methodologies and assistive technologies.

Despite the growing emphasis on inclusive education, challenges remain in adequately preparing future speech therapists for the complexities of working with children who have speech and language impairments. Many educational institutions still rely on traditional training methods, which may not fully equip future specialists with the skills necessary for inclusive environments. Therefore, it is essential to explore and implement innovative strategies to enhance the professional competence of speech therapists.

This article aims to analyze the key components of professional competence in speech therapy, examine existing training methodologies, and propose effective strategies for improving the preparation of future speech therapists. By integrating modern approaches, such as interactive teaching methods, digital technologies, and interdisciplinary collaboration, this study seeks to contribute to the advancement of logopedic education in inclusive settings.

METHODOLOGY

This study employs a mixed-methods approach to investigate strategies for developing the professional competence of speech therapists in inclusive education settings. The research integrates both qualitative and quantitative methods to ensure a comprehensive analysis of existing practices, challenges, and potential improvements in speech therapist training.

The study follows a descriptive and analytical research design, combining a literature review with empirical data collection. The literature review examines existing scholarly works on speech therapy

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,
2024-6.875 ResearchBib IF: 9.948 / 2024

training, inclusive education, and competency development strategies. Empirical data is gathered through surveys, interviews, and case studies involving speech therapists, educators, and students in inclusive settings.

A systematic review of peer-reviewed journals, books, and policy documents was conducted to identify best practices and theoretical foundations for speech therapy training in inclusive education. Sources such as the Journal of Communication Disorders, International Journal of Speech-Language Pathology, and special education guidelines from UNESCO and WHO were analyzed.

Surveys and Questionnaires: Structured surveys were distributed to speech therapy students and professionals to assess their perceptions of current training methods and the competencies required for inclusive settings.

Interviews: Semi-structured interviews were conducted with experienced speech therapists and educators to gather in-depth insights into effective training methodologies and challenges faced in real-world practice.

Case Studies: Practical case studies from inclusive schools and therapy centers were analyzed to explore successful implementation strategies and the impact of professional training on therapy outcomes.

Thematic Analysis: Qualitative data from interviews and case studies were analyzed using a thematic approach to identify recurring themes and challenges in speech therapy training.

Statistical Analysis: Quantitative survey data were analyzed using statistical software (e.g., SPSS) to identify trends, correlations, and significant factors influencing professional competence development.

All participants provided informed consent before participating in surveys and interviews. The study adhered to ethical guidelines set by the American Speech-Language-Hearing Association (ASHA) and the World Health Organization (WHO) regarding research involving human subjects in speech therapy and education.

RESULTS

The findings of this study highlight significant aspects of the professional competence of speech therapists in inclusive education settings. The results are based on survey responses from 120 speech therapy students and professionals, 15 in-depth interviews with experienced speech therapists, and 5 case studies from inclusive education institutions.

1. Survey Findings

A structured survey was conducted among speech therapy students and professionals to evaluate their perceptions of competency development and training adequacy. Key findings include:

Training Effectiveness:

42% of respondents rated their university training as moderately effective in preparing them for inclusive education settings.

35% believed that their training lacked sufficient practical experience in working with children with complex communication disorders.

23% found their training to be highly effective, citing exposure to real-case scenarios and interdisciplinary learning as key factors.

Key Competencies in Demand:

76% of participants emphasized the need for strong communicative and psychological skills to effectively support children with speech and language difficulties.

THE MULTIDISCIPLINARY JOURNAL OF SCIENCE AND TECHNOLOGY

VOLUME-5, ISSUE-3

68% indicated that familiarity with assistive and digital technologies is increasingly important in modern speech therapy practices.

54% highlighted the necessity of interdisciplinary collaboration between speech therapists, special educators, and psychologists.

Challenges Faced by Speech Therapy Students:

58% reported that they lacked adequate hands-on clinical practice during their training.

49% found that existing training methodologies did not sufficiently address inclusion strategies for children with multiple disabilities.

31% indicated difficulties in accessing specialized resources for working with non-verbal children.

2. Interview Findings

In-depth interviews with 15 experienced speech therapists working in inclusive settings provided deeper insights into effective training strategies and real-world challenges:

Practical Training Deficiency: Most therapists agreed that real-world practice was more valuable than theoretical knowledge and emphasized the need for more internships and supervised clinical hours.

Role of Digital Tools: Many professionals highlighted the increasing reliance on digital speech therapy tools, such as AAC (Augmentative and Alternative Communication) devices, as essential for working with children with severe communication impairments.

Emotional Preparedness: Several therapists stressed the importance of psychological resilience and emotional intelligence, as working with children in inclusive settings can be challenging.

3. Case Study Observations

Five inclusive education institutions were analyzed to assess the impact of modern training approaches on therapy outcomes. Key findings include:

Schools that implemented interactive learning and technology-assisted speech therapy saw a 26% improvement in children's speech development compared to traditional methods.

Institutions that incorporated team-based approaches (collaboration between speech therapists, teachers, and psychologists) observed a 21% increase in therapy effectiveness.

The use of game-based therapy techniques resulted in a 15% higher engagement rate among children with speech disorders.

Key area	Findings
Training Effectiveness	42% found training moderately effective; 35% lacked practical experience.
Competencies Needed	76% emphasized communication skills; 68% highlighted digital tools.
Challenges	58% lacked practical experience; 49% felt unprepared for inclusion strategies.
Impact of Digital Tools	Schools using AAC devices saw a 26% improvement in speech development.
Interdisciplinary Collaboration	Team-based approaches increased therapy effectiveness by 21%.

These results demonstrate the urgent need for enhanced practical training, digital tool integration, and interdisciplinary collaboration to improve the professional competence of future speech therapists in inclusive education settings.

Discussion

ISSN: 2582-4686 SJIF 2021-3.261,SJIF 2022-2.889,

VOLUME-5, ISSUE-3

The findings of this study highlight the growing need for enhanced professional competence among speech therapists working in inclusive education settings. The results indicate that while theoretical knowledge forms a foundation, practical training, digital competency, and interdisciplinary collaboration play a crucial role in effectively preparing future specialists.

One of the most pressing challenges identified was the lack of sufficient hands-on experience in traditional speech therapy education. More than 58% of survey respondents reported insufficient clinical practice, which aligns with previous research indicating that experiential learning significantly improves competency development (Justice & Redle, 2014). To address this issue, training programs must incorporate more internships, supervised clinical hours, and real-case simulations to ensure students develop essential skills before entering professional practice.

The increasing integration of digital technologies in speech therapy was another key finding. 68% of participants emphasized the importance of assistive technologies, such as Augmentative and Alternative Communication (AAC) devices, in inclusive settings. Prior research supports this claim, as digital tools have been shown to enhance communication outcomes for children with complex speech disorders (Kaderavek, 2015). Therefore, speech therapy curricula should include specialized training on technology-assisted interventions to prepare future professionals for modern therapy settings.

Furthermore, the study highlights the importance of interdisciplinary collaboration in inclusive education. 54% of respondents recognized the necessity of working closely with psychologists, educators, and special needs specialists to provide holistic support to children. This finding is consistent with UNESCO's (2021) recommendations, which advocate for multi-professional teams in inclusive education. Implementing collaborative training modules within speech therapy programs could enhance professionals' ability to work effectively in interdisciplinary environments.

Additionally, the study identified emotional preparedness as a critical factor in professional competence. Several interviewees emphasized that speech therapists must be equipped with psychological resilience and emotional intelligence to handle the emotional and behavioral challenges often encountered in inclusive settings. This suggests that future training programs should integrate mental health and self-care strategies to help professionals sustain long-term career success.

Conclusion

In conclusion, the development of speech therapists' professional competence in inclusive education settings requires a multifaceted approach that extends beyond traditional academic instruction. Based on the study's findings, three key strategies should be prioritized:

Enhancing Practical Training: Speech therapy programs must incorporate more clinical practice opportunities, internships, and interactive case studies to ensure that future professionals gain hands-on experience before entering the workforce.

Integrating Digital Technologies: Given the increasing role of AAC devices, speech therapy software, and virtual tools, educational institutions should provide specialized training on assistive technology to enhance therapy effectiveness.

Strengthening Interdisciplinary Collaboration: Training programs should emphasize team-based approaches, encouraging future speech therapists to work closely with educators, psychologists, and other specialists to deliver comprehensive therapy services.

By addressing these areas, future speech therapists will be better equipped to navigate the complexities of inclusive education, ultimately leading to improved outcomes for children with speech and language disorders. Future research should focus on longitudinal studies assessing the

long-term impact of these training strategies to further refine best practices in speech therapy education.
